                                                                                     Region
                                                                                                                                                                                              Region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Region
           variable region, La, directed against leukocyte adhesion molecule
variable region, La, directed against leukocyte adhesion molecule
VLA-4. Cloned CDNA sequences of mouse 21.6 VL and VH (AAQ99889 and
AAQ99829. regions are linked to human constant regions in the
construction of a humanized antibody against VLA-4. The 5' and 3'
ends of the mouse cDNAs are modified using PCR primers (See
AAQ9989-289) and then subcloned into mammalian cell expression vectors
containing human kappa or gamma-1 constant regions. In the humanized
light chain, amino acids L45, L58 and L69 in the humanized
containing human kappa or gamma-1. L49, L58 and L69 in the humanized
light chain, amino acids L45, L58 and L69 in the humanized
containing human kappa or gamma-1.

Containing human kappa or gamma-1.

PR framework are replaced by the amino acid present in the equivalent
position of the mouse 21.6 Ig L chain. Plasmids encoding the chimeric
antibodies are transfected into COS cells. The humanized antibodies
can be used for inhibiting adhesion of a leukocyte to an endothelial
cell and for treating inflammatory diseases such as multipple
sclerosis. They can also be used in the treatment of stroke,
cerebral traumas, meningitis or encephalitis. The antibodies can
also be used for detecting VLA-4, for affinity purification or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

This polypoptide, designated La, comprises the light chain variable region (VL) of a humanised alpha-4 integrin antibody 21.6. It is composed of complementarity determining regions (CDRs) from the VL region (see AAW22409) of mouse alpha-4 integrin monoclonal antibody al.6 and a modified human REI framework. It can be expressed in mammalian host cells following PCR amplification and mutagenesis of appropriate fragments of mouse and human DNA sequences. The humanised 21.6 VL and a humanised 21.6 VK and a humanised 21.6 VL and be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     to produce a claimed humanised 21.6 antibody that its useful in the manufacture of a medicament for treating asthma, atherosclerosis, AIDS, dementia, diabetes, inflammatory bowel disease, rheumatoid arthritis, transplant rejection, graft versus host disease, theumatoid ischaemia, and acute leukocyte mediated lung injury. The antibody for use as a vaccine or an immunogen. It is also useful for generating idiotypic antibodies. The humanised antibody has a half-life in the human circulation essentially equivalent to that of naturally occurring human antibodies.
                                                                                                                                             "21.6 complementarity determining region 2"

This polypeptide, designated La, comprises the light chain variable region (VL) of a humanised alpha-4 integrin antibody 21.6 (see also AMV22412). It is composed of complementarity determining regions from the VL region (see AMV22409) of mouse alpha-4 integrin monoclonal antibody 21.6 and a modified human REI framework. It can be expressed in mammalian host cells following PCR amplification and mutagenesis of appropriate mouse and human DNA sequences. The humanised 21.6 VL and a humanised 21.6 VH (see AMV22413) can be used to produce a claimed humanised 21.6 antibody that is useful in the manufacture of a medicament for treating asthma, atherosclerosis, contrictis, transplant rejection, graft versus host disease, theumatic metastasis, nephritis, atopic dermatitis, psoriasis, mycoardial ischemia, and acute leukocyte mediated lung injury. The humanised antibody has a half-life in the human circulation essentially equivalent to that of naturally occurring human antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The sequence represents the mouse anti-VLA-4 antibody 21.6 light chain variable region (without signal sequence). Cloned cDNA CDR sequences of mouse 21.6 variable light and variable heavy regions are linked to human constant framework regions of the REI antibody for the light chain and the 2*CL antibody gainst VLA-4. The 5' and 3' ends of the mouse cDNAs are modified using PCR primers (See AAQ99895-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized light chain, amino acids L45, L49, L58 and L69 in the human kappa LCWR framework are replaced by the amino acid present in the equivalent position of the mouse 21.6 Ig light contain the humanized antibodies are transfected into COS acid present in the equivalent position of the mouse 21.6 Ig light colain. The humanized antibodies can be used to inhibit adhesion of a leukocyte to an endothelial cell and to treat inflammatory diseases such as multiple solerosis. They can also be used in the treatment of stroke, cerebral traumas, meningitis or encephalitis. The antibodies can also be used for detecting VLA-4, for affinity purification or for generating anti-idiotype antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

The sequence represents the mouse antibody 21.6 light chain variable region directed against leukocyte adhesion molecule VLA-4. Cloned CDNA sequences of mouse 21.6 VL and VH (see AAQ9892) regions are linked to human constant regions in the construction of a humanized antibody against VLA-4. The 5' and 3' ends of the mouse cDNAs are modified using PCR primers (See AAQ9895-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized light chain, amino acids LA5, L49, L58 and L69 in the human kappa LC VR framework are replaced by the amino acid present in the equivalent position of the mouse 21.6 fl Chain. Plasmids encoding the chimeric antibodies are transfected into COS cells. The humanized antibodies can be used to inhibit adhesion of a leukocyte to an endothelial cell and

Cloned CDNA sequences of mouse 21.6 VL (AAQ99889) and VH (AAQ99892)
regions are linked to human constant regions in the construction
of a humanized antibody against VLA-4. The 5' and 3' ends of the
mouse cDNAs are modified using PCR primers (See AAQ99895-98) and
then subcloned into mammalian cell expression vectors containing
human kappa or gamma-1 constant regions. In the humanized light
chain, amino acids LAS, L49, L58 and L69 in the human kappa LC VR
framework are replaced by the amino acid present in the equivalent
                                                                                                                                                              Human VLA-4 reshaped antibody 21.6 light chain variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence represents the human reshaped antibody 21.6 light

                chimeric antibodies are transfected into COS cells. The humanized antibodies can be used to inhibit adhesion of a leukocyte to an antibodies can be used to train inflammatory diseases such as multiple sclerosis. They can also be used in the treatment of stroke, cerebral traumas, menigitis or encephalitis. The antibodies can also be used for detecting VLA 4, for affinity purification or for generating anti-idiotype antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Alpha-4 integrin; humanised antibody; monoclonal antibody 21.6;

                                                                                                                                                                                                                                                                                                 This polypeptide comprises the light chain variable region (VL) of mouse anti-alpha-4 integrin monoclonal antibody 21.6. The complementarity determining regions (CDRs) of the 21.6 VL can be incorporated into a human REI framework to produce a claimed humanised 21.6 VL (see AAW22412) and a claimed humanised 21.6 vL (see AAW22412) and a claimed humanised 21.6 antibody that is used in the manufacture of a medicament for treating a disease selected from asthma, atherosclerosis, AIDS, dementia, diabetes, inflammatory bowel disease, rheumatoid arthritis, transplant rejection, graft versus host disease, tumour metantic, and the contraction of the contraction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   metastasis, nephritis, journelly partitives incommetastasis, nephritis, atopic dermattis, psoriasis, myocardial ischaemia, and acute leukcoyte mediated lung injury. The antibody may also be used in the affinity purification of alpha-4 integrin for use as a vaccine or an immunogen. It is also useful for expensating idiotypic antibodies. The humanised antibodies of the quivention have a half-life in the human circulation essentially equivalent to that of naturally occurring human antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

The present invention describes fusion proteins comprising a chemokine and a tumour antigen or HIV antigen. Specifically claimed fusion proteins comprise: (1) human monocyte chemotactic protein.3 (WCP-3) and human monocyte chemotactic protein.3 (WCP-3) and human Muc-1; (2) human interferon-induced protein 10 (IP-10) and human Muc-1; (3) human Muc-1; (5) human PDC and HIV gpl20; and HIV gpl20; (6) human MCP-3 and HIV gpl20; (7) human MCP-3 and HIV gpl20; and (8) human SDF-1 and HIV gpl20; (7) human MCD and HIV gpl20; and elso proteins and nucleotide sequences encoding them, can be used for producing an immune response, e.g. an effector T cell immune response. They can also be used for tracting cancer or treating or preventing HIV infection. The fusion proteins and/or nucleotide sequences can be used in in vitro diagnostic assays, as well as in screening assays. Con identifying unknown tumour antigen epitopes and fine mapping of trumour antigen epitopes. The present sequence represents a fusion protein contact invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó;

and a tumour antigen or HTV antigen. Specifically claimed fusion proteins comprise: (1) human monocyte chemotactic protein-3 (MCP-3) and human Muc-1: (2) human interferon-induced protein 10 (1p-10) and human Muc-1: (3) human macrophage-derived chemotine (MDC) and human Muc-1: (4) human SDF-1 and human Muc-1: (4) human EDF-1 and human Muc-1: (4) human EDF-1 and HTV gpl20: (6) human MCP-3 and HTV gpl20: (7) human MDC and HTV gpl20: and (8) human SDF-1 and HTV gpl20: (7) human MDC and HTV gpl20: and (8) human SDF-1 and HTV gpl20: The fusion proteins, and nucleotide sequences encoding them, can be used for producing an immune response. e.g. an effector T cell immune preventing HTV infection. The fusion proteins and/or nucleotide sequences can be used in in vitro diagnostic assays, as well as in screening assays for identifying unknown tumour antigen epitopes and fine mapping of furner the mathem epitopes. The present sequence represents a fusion protein present invention describes fusion proteins comprising a chemokine from the present invention.

Hybridoma antibodies have been produced with the spleen cells of BALB/c mouse that had received multiple injections of mercuric ions reacted with glutathione to produce a mercuric ion coordinate covalent compound which was covalently bound to keyhole limpet hemocyanin (KLH). Eight hybridomas (1F10, 4A10, 1C11, 5G4, 23F8, 2D5, 5B6 and 3E8) were producing Mabs that were strongly positive against glutatione-mercuric ions but negative against glutathione without mercuric ions. RNA was isolated from hybridoma cells with guanidine isothiocyanate. First strand cDNA synthesis was catalysed by MuLv reverse transcriptase. The primers used for cDNA synthesis were complementary to the 5' end of the CH1 domain of the heavy creat newscriptase. The primers used for cDNA synthesis are chain expressed by the hybridoma of interest, or to the 5' and of che chain expressed by the primers used for cDNA synthesis are shown in AAQ97511-Q97518. The primer used for cDNA synthesis of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptide(s) which bind heavy metals, esp. mercury - derived from monoclonal antibodies, used for detecting, removing, adding or
This is an example of a CDR-grafted light chain of the invention. The constant regions are based on sequences of the human kappa constant domain, the signal sequence is derived from murine MAD B72.3 and the CDR sequences are based on the murine OKT4A light chain CDRs. The recombinant antibody encoded by this sequence has affinity for CD4 similar to that of OKT4A.

variable region of a particular antibody polypeptide was also used for PCR amplification of that variable region, in conjunction with an appropriate V-region primer. In addition, the VH primer AAQ97518 was used to amplify the mAD 2D5 and 5B6 heavy chains. The sequences of the PCR amplified nucleotides were determined. These are given in AAQ9789-097510 and the deduced AA sequences in AAR7941-R79250 & AAR78970-R78971. The descriptions of the SEQ ID nos given on pp 44-45 and in the claims are different from the descriptions in the sequence listings. The descriptions in the sequence listings are

                                                                                                                                                                                          The present sequence is that of the variable region of the kappa light chain from murine monoclonal antibody K20. The antibody recognises the beta 1 subunit (CD29) of integrins and inhibits activation and proliferation of peripheral T cells induced by anti-CD3 antibodies. Monoclonal antibody K20 is a preferred target for humanisation; the humanised version may be useful as an immunosuppressant. In the humanisation process, the complementarity
